**Abstract:** The comparison of topotypes of *Phryinus barbadensis* (Pocock, 1893) with specimens of *Phryinus gervaisii* (Pocock, 1894) from Costa Rica, Colombia, Venezuela and Trinidad and Tobago has shown that the latter species is a junior synonym of the former. Also, for the first time, this species is recorded from Aruba (Netherlands Antilles).

**Key words:** Amblypygi, Phrynidæ, Phryninae, *Phryinus*, taxonomy, South America, Central America, Antilles.

***Phryinus gervaisii* (Pocock, 1894) es un sinónimo más moderno de *Phryinus barbadensis* (Pocock, 1893) (Amblypygi: Phrynidæ)**

**Resumen:** La comparación de topotipos de *Phryinus barbadensis* (Pocock, 1893) con una amplia muestra de *Phryinus gervaisii* (Pocock, 1894) procedente de Costa Rica, Colombia, Venezuela y Trinidad y Tobago ha demostrado que esta última especie es un sinónimo más moderno de aquella otra. Además, por primera vez se registra esta especie para Aruba, Antillas Holandesas.

**Palabras clave:** Amblypygi, Phrynidæ, Phryninae, *Phryinus*, taxonomía, Sudamérica, Centroamérica, Antillas.

**Taxonomy/taxonomía:** *Tarantula gervaisii* Pocock, 1894 = *Tarantula barbadensis* Pocock, 1893, **syn. n.**

### **Introduction**

Pocock (1893) described *Tarantula barbadensis* (at the present in the genus *Phryinus* Lamarck, 1801) from Barbados, Lesser Antilles. A year later, he described *Tarantula gervaisii* from “Magdaleine”, Colombia, but he also recorded “specimens of apparently the same species from Venezuela, Trinidad and British Guiana” (Pocock, 1894: 286). Pocock (1902b: 51) recorded *Phryinus barbadensis* from Panamá, Colombia, Venezuela and Trinidad, but Quintero (1981) recognized those populations as *Phryinus gervaisii*, while he mentioned *P. barbadensis* only from Barbados and Saint Vincent.

Kraepelin (1912: 28) recorded *P. barbadensis* (as *Tarantula palmata barbadensis*) from Colombia, whereas Schenkel (1953: 1) mentioned this species from Venezuela. Dealing with those records, Harvey (2003: 26) suggests that they might be misidentifications. On the other hand, Alexander (1962a, b) mentioned this taxon from Trinidad Island, a record overlooked by Quintero (1981) and subsequent authors (Armas, 2006: 232).

Undoubtedly, *P. barbadensis* and *P. gervaisii* are morphologically similar (Quintero, 1981; Armas, 2006). Taken in account its likeness, Chiriví Joya & Armas (2012: 398) suggested that both nominal taxa might be the same species.

We have examined *P. barbadensis* from Barbados (type locality), Costa Rica, Colombia, Venezuela, Aruba, Trinidad and Tobago, but we have not found relevant taxonomic characters for recognize more than one species.

### **Material and methods**

The studied specimens are deposited in the following collections: ACJ: Arachnological Collection of the Pontificia Universidad Javeriana, Bogotá, Colombia.

ICN: Instituto de Ciencias Naturales, Universidad Nacional de Colombia, Bogotá, Colombia.

IES: Instituto de Ecología y Sistemática, Havana, Cuba.

NHMW: Natural History Museum Vienna, Austria.

SM: Seiter Michael's personal collection, Pottendorf, Austria.

USNM: U. S. National Museum (Smithsonian Institution), Washington, D. C.

Only synonyms and most relevant references are included, as well as those posterior to Harvey (2003). For the Colombian localities, the term “vereda” correspond to an administrative section of the municipality.

Nomenclature of pedipalp spines follows Quintero (1983), modified according with Shultz (1990): F, femur; P, patella; T, tibia; d, dorsal; v, ventral.

### **Taxonomy**

*Admetus barbadensis*: Alexander, 1962a: 380–382. Alexander, 1962b: 25–36, fig. 1 a–b, 3 a–c, 4 a–b.

*Tarantula (Phryinus) palmata*: Weygoldt, 1977: 271, 272.

*Phryinus. barbadensis*: Armas, 2006: 242 (*lapsus calami*).

**TYPE DATA.** Of *Tarantula barbadensis*: Male holotype from Barbados, West Indies, in the British Museum of Natural History (not

**Fig. 1.** *Phryinus barbadensis*. Geographical distribution.

examined); according with Quintero (1981: 145), the specimen is “in poor condition, legs and pedipalps fractured”. Of *Tarantula gervaisii*: Male holotype from Magdalene, Colombia, in the British Museum of Natural History (not examined). *Phryinus caracasanus* was described on basis to embryo sections only; the adult female identified as the type of this species in the Muséum National d’Histoire Naturelle (Paris) is not a type specimen (Quintero, 1981: 147).

**DISTRIBUTION.** Central America (Costa Rica, Panama), South America (Colombia, Venezuela, Trinidad, Tobago, Guyana, Ecuador), and the Lesser Antilles (Aruba, St. Vincent, Grenadines, Barbados) (Fig. 1).

**DIAGNOSIS** (emended). Total length 12–22 mm; general color dark reddish brown, spotted with brown on the tergites; carapace with two distinct pale yellow spots on each posterior ectal angle; legs II–IV with three yellow bands on the femora. Carapace: anterior margin slightly emarginate, frontal area well to moderately definite. Pedipalps (fig. 2 C–F): trochanter with five anteroventral spines (one of them on the central area); femur: Fd-3>Fd-2, Fv-1 and Fv-2 on a common base, near to Fv-3; patella: Pd-2>Pd-4>Pd-6, in most specimens Pd-5 is the longest; tibia: Td-1 short, approximately one-third as long as Td-3; tarsus without a dorsobasal internal spine. Chelicerae: basal segment with two external teeth, of which the proximal (superior) is a blunt ridge (fig. 2 A–B). Leg IV with basitibia tripartite. Female: gonopods with two sclerites moderately wide in its base, and the apical part bent towards the ventral surface (fig. 3 A–D; Peretti, 2002: fig. 9–10).

**VARIATIONS.** The proximal external tooth of the basal segment of the chelicera (**a** in fig. 2 A–B) may be poorly developed (Chiriví Joya & Armas, 2012). Tibial articles of leg I commonly vary from 30 to 32, rarely with a higher count; tarsal articles vary from 64 to 66. In largest specimens, the carapace granulation seems to be finer than in the smaller ones (fig. 3 E–F). Frontal process of the prosoma may be concealed. Frontal area of the carapace may be distinctly or poorly delimited (fig. 3 E–F). In some specimens, pedipalp spine Pd-4 is similar or noticeably shorter than Pd-2; in shortest specimens, spine Fd-6 is lacking. General color pattern is also variable, principally on carapace and abdomen (dark brown spots may be vanished or well-defined).

**ANOMALOUS PEDIPALP SPINATION.** The examined male from La Orchila, Perijá Range (Venezuela) has left pedipalp with spine Pd-2 slightly shorter than Pd-2.

**COMPARISONS.** *Phryinus barbadensis* clearly differs from its congeneric by having the basal segment of the chelicerae with only two external teeth, the proximal one being modified into a blunt ridge

(fig. 2 A–B). This character is only shared with *Phryinus santarensis* (Pocock, 1894), from Brazil, but the sclerites of the female gonopods of *Ph. barbadensis* are noticeably stouter [slender in the Brazilian taxon (Quintero, 1981, fig. 150)].

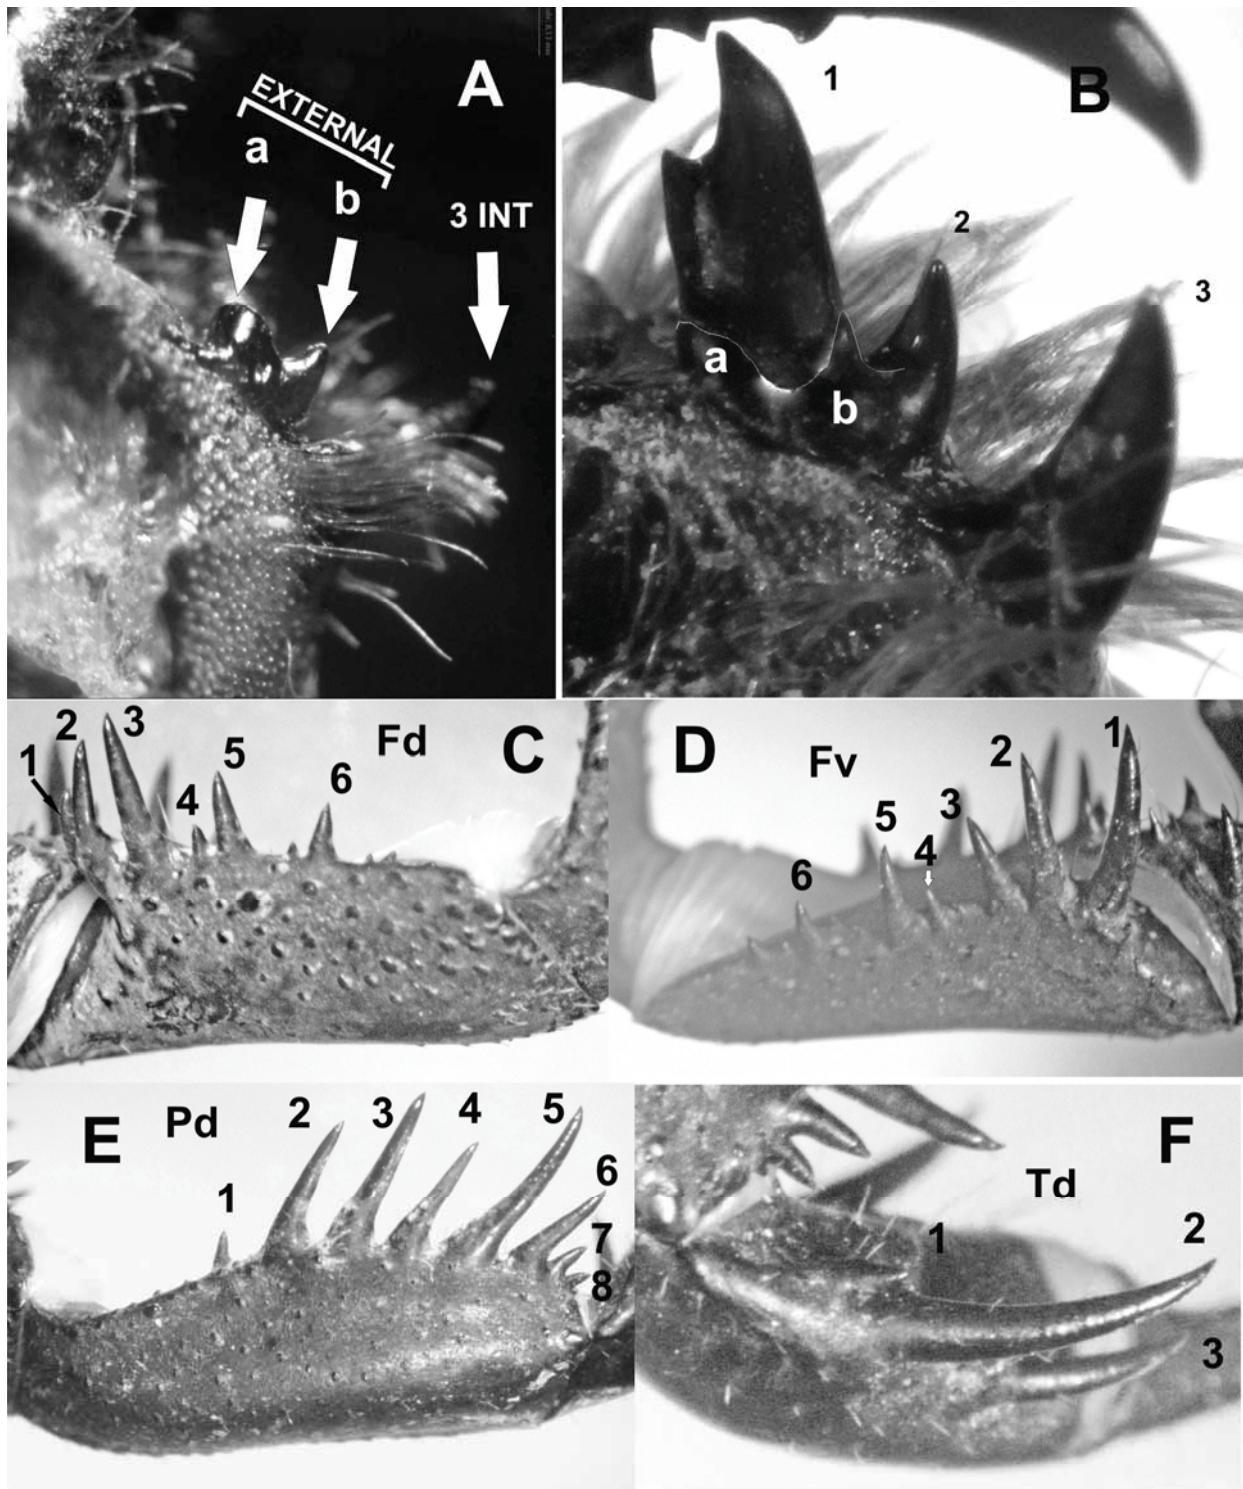

Another South American species, *Phryinus pulchripes* (Pocock, 1894) has two external teeth on the basal segment of the chelicerae, but they are conic. Also, in this taxon the pedipalp tarsus has a minute dorsal basal spine in the internal surface, and female gonopods are characteristic (Quintero, 1981; Armas & Pérez González, 2001; Chiriví Joya & Armas, 2012).

As suggested by Armas & Pérez González (2001), *P. barbadensis* seems to be closely related to *P. santarensis*.

According with Quintero (1981: 147), *P. gervaisii* differs from *P. barbadensis* by having a poorly defined frontal area, and by the dark variegated abdomen. But, as expected in a widespread species, those characters are variable. For example, he mentioned a Trinidad specimen with “a well-defined frontal area, distinct from the rest of carapace”. We have not detected relevant differences among the large amount of examined specimens from several countries, including the type locality. Upon this result, we propose to relegate *Tarantula gervaisii* Pocock, 1894 (at the present in the genus *Phryinus*) as a junior synonym of *Phryinus barbadensis* (Pocock, 1893).

**NATURAL HISTORY.** *Phryinus barbadensis* has been found in several habitats, including termite and ant nest, caves, primary and secondary forest, anthropogenic areas, cacao plantations, mangrove forest, from sea level to 1440 m a.s.l. (Pocock, 1894; Quintero, 1981; LeClerc et al., 1987; Weygoldt, 1994; Viquez, 2003; Chiriví Joya & Armas, 2012). Observations on its reproductive biology are in Alexander (1962a, b), Weygoldt (1977), Quintero (1981), and Peretti (2002). Females have been recorded carrying 9–52 eggs or embryos (Quintero, 1981; Armas, 1999; Viquez, 2003; Chiriví Joya & Armas, 2012).

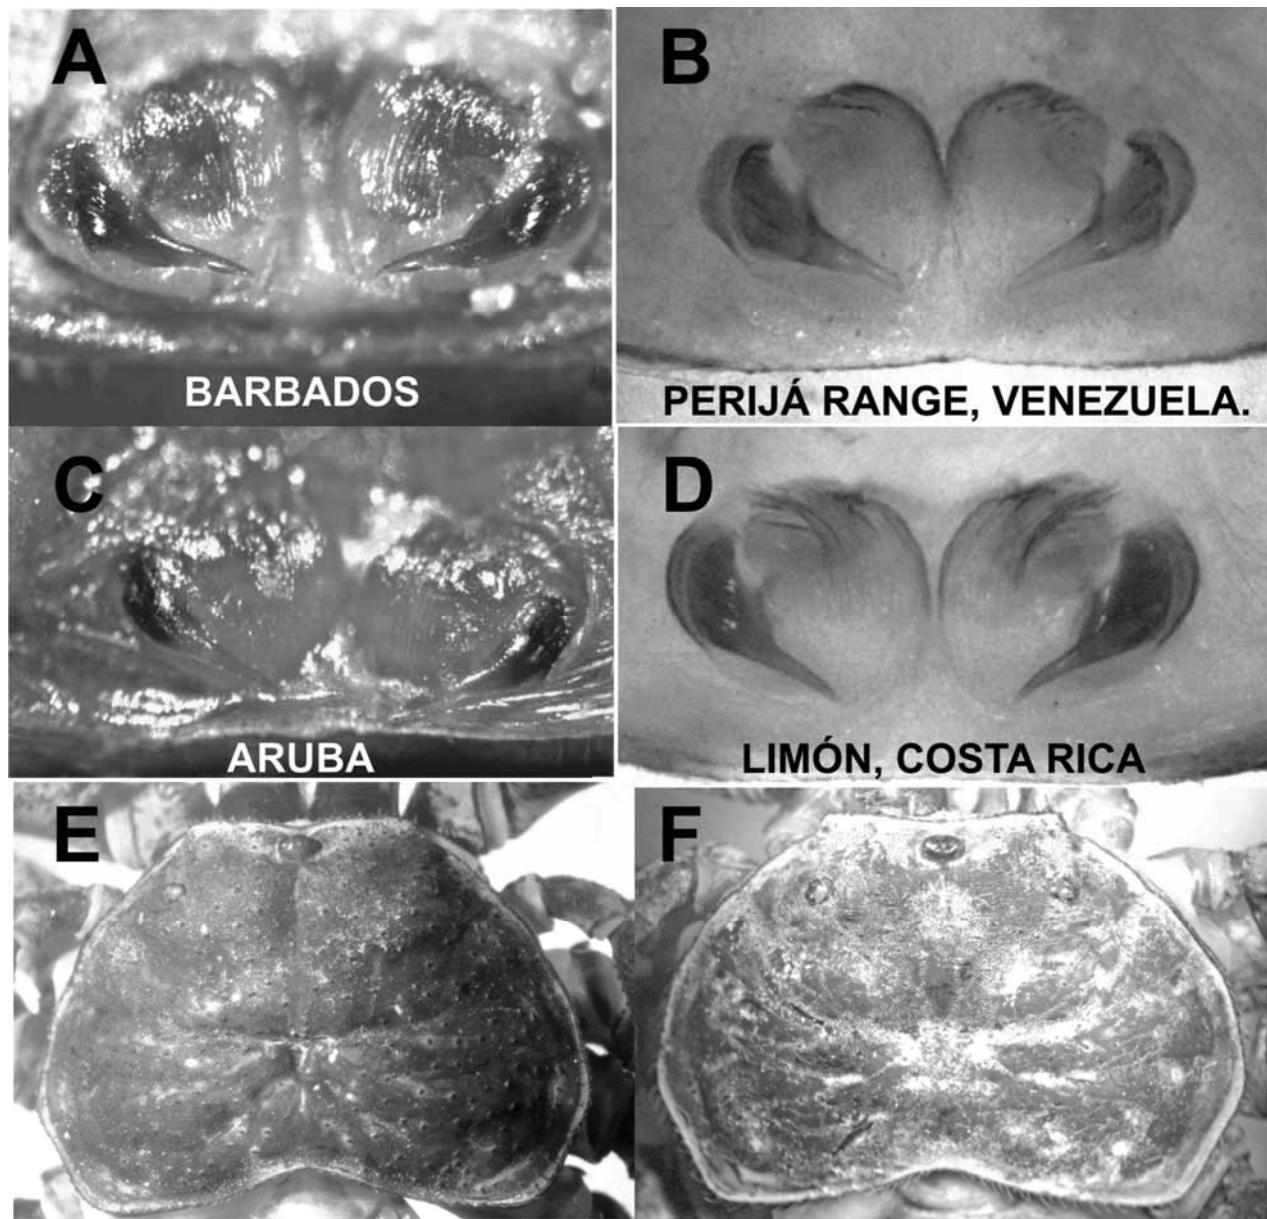

**EXAMINED SPECIMENS.** COSTA RICA: Limón province: Hone Creek: Alberto Moore farm (N 09° 67.546 – W 82.80554, 11 m a.s.l.), 8–11 October, 2004, parcel of land #4, cacao-banana plantation, under trunk, C. Viquez, 1♂ (IES). Alberto Moore farm (N 09° 67.546 – W 82.80554, 11 m a.s.l.), 3 September, 2004, parcel of land #3, cacao-*Cordia* plantation, under trunk, C. Viquez, 1♀ (IES). #### Acknowledgement

We greatly appreciate specimens provided by César Augusto Roncallo (Riohacha, La Guajira, Colombia), Carlos Víquez (INBio, Costa Rica), Pío A. Colmenares (Maracaibo, Zulia, Venezuela). The first author (LFA) extends his gratefulness to Eduardo Flórez Daza, David Luna Sarmiento and Ingrid Catalina Romero Ortiz (ICN), and Daniel Chiriví Joya (ACJ), for their permission and assistance during examination of specimens in their museums; special thanks to E. Flórez Daza and his family for warm hospitality on November–December, 2011. Rolando Teruel (Bioeco, Santiago de Cuba) revised the manuscript and contribute to its improvement. We also extend our gratitude to anonymous referees for their utile comments.
